

CUBE / SBC cheat sheet

Topology

CUCM 192.0.2.30 – SIP – CUBE
192.0.2.40 / 198.51.100.10 – SIP – ITSP
203.0.113.10. The provider sees the SBC,
not every phone.

Normalization

SIP profiles add, strip, or map headers.
Identity may move through P-Asserted-
Identity (RFC 3325). Force early offer only
if the peer refuses an INVITE without SDP.
Keep a before-and-after trace.

UC Lab field card · fictional examples only · confirm RFCs and current vendor docs
before production changes.

Media

- Flow-through (default): RTP anchors on CUBE. SDP c= is the SBC.
- Flow-around: RTP goes end to end. Signaling still hits CUBE.
- Transcode, SRTP-to-RTP, and media DTMF interworking need flow-through.

Encryption

- 5060 SIP UDP/TCP. 5061 SIP TLS. RTP ports come from SDP.
- sips: means TLS on every hop. sip: plus a TLS dial-peer is one hop.
- RTP/SAVP and a=crypto: SDP key in SDP. Use TLS on that signaling.
