

CUCM to Webex Calling cheat sheet

1. Discover

Users, devices, numbers, trunks, hunt groups, voicemail, analog, fax, dial plan, class of service, E911, recording, contact center, and integrations you must retest.

2. Design

Map sites to Webex Calling locations. Choose cloud PSTN or a Local Gateway. Write the feature gaps down. Confirm device firmware (many desks need Multiplatform phones) and what happens if the cloud path fails.

3. Port

Letter of authorization and a firm date, or keep the carrier and hairpin through the Local Gateway. Do not port ranges you do not own.

UC Lab field card · fictional examples only · confirm RFCs and current vendor docs before production changes.

4. Pilot

One team. Inbound, outbound, voicemail, and an emergency test on the provider's test number. Keep a return path to CUCM.

5. Cut over

Waves by site or number block. Freeze unrelated dial-plan edits. Watch completion and emergency calls.

6. Retire

Soak, then remove old trunks, nodes, DNS, and unused certificates. Test 911 again after the old path is gone.
